The effects of perceived control and social support on the psychological well-being of older adults. This study assessed the effects of perceived control and social support on the psychological well-being of older adults. The study consisted of two parts: (a) a descriptive study of perceived control and psychological well-being, and (b) a correlational study of perceived control, psychological well-being, and social support. Participants in Study 2 were 102 community-dwelling adults over the age of 60. Subjects from the first study formed the subjects in the second. Results indicate that perceived control and social support are significantly correlated with psychological well-being and that the relationships between these factors may be causal. Implications for nurses are discussed.U.
